

Three-Year Review (2023–2025) across Overview, Product & Profitability, and Customer & Order Analysis

Executive Summary

All three dashboards tell one consistent story: **2024 was a soft year, and 2025 was a recovery, but a narrower and more fragile one than the headline numbers suggest.** Sales and profit dipped in 2024 and rebounded in 2025—but the 2025 rebound came from fewer, higher-value orders and a shrinking, more concentrated customer base, not broader demand. Underneath that cycle, two problems have been getting worse every year regardless of the up-and-down headline numbers: customer retention and loss-making orders in Paper.

- **Technology** is the business's core engine—it drives the most sales and the sharpest swings and sits in the top profit-margin tier across all three years. Its 2024 dip explains most of that year's company-wide decline.
- **Home Office** overtook Consumer as the top segment starting in 2024 and has stayed on top—visible identically in both the Overview and Customer dashboards, so this is a real shift in who NexaRetail sells to.
- **The repeat customer rate fell for three straight years** (60.78% → 59.00% → 58.70%)—the only metric in this entire review that moved in one direction the whole time. The top-5 customers by sales are entirely different people every year.
- **Paper's loss-making orders rose 60% in three years** (15 → 18 → 24), consistently the worst or near-worst offender, tracking a broader pattern where any discounting on already-thin-margin items (paper, pens, sofas, tables) tips orders into losses.
- **2025's recovery is real but narrower:** sales and profit are up, margin is at a 3-year high, but customer count and order count are both down. Growth came from value per transaction, not more transactions or more customers.

The three sections that follow walk through each dashboard in turn—what happened, why, and what to do—and the final section brings the threads together into one prioritized action list.

KPIs at a glance

	2023	2024	2025
Total Sales	Rs. 240.13M	Rs. 235.07M	Rs. 238.04M
Total Profit	Rs. 35.76M	Rs. 33.58M	Rs. 35.48M
Profit Margin	14.89%	14.28%	14.90%
Loss-Making Orders	191	209	200
Total Customers	1,614	1,627	1,603
Repeat Customers %	60.78%	59.00%	58.70%

Dashboard-1

Overview: Sales, Profit & Margin

The company-wide V-shape and what drove it

What Happened

- **2023 → 2024 was a step down:** sales fell 2.11% (Rs. 240.13M → Rs. 235.07M) and profit fell a sharper 6.09% (Rs. 35.76M → Rs. 33.58M), pulling margin from 14.89% to 14.28%—even as order count rose 1.62%. More orders, less revenue, and less profit point to falling basket size and margin pressure, not weaker demand.
- **2024 → 2025 was a recovery,** but a different kind of business drove it. Sales rebounded to Rs. 238.04M (+1.26%), and profit jumped 5.66% to Rs. 35.48M—a 3-year-high margin of 14.90%—but with fewer orders (–3.34%). Fewer, richer orders, not more transactions, drove the rebound.

Total Sales vs. Total Profit, 2023–2025

Profit Margin: dipped in 2024, recovered to a 3-year high in 2025.

Why it happened

- **Technology carried, then rescued, the business.** Technology sales dropped from Rs. 148.97M (2023) to Rs. 140.79M (2024)—the single biggest driver of that year's decline—then rebounded to Rs. 149.52M in 2025. Technology profit followed the identical V-shape (Rs. 24.7M → Rs. 22.4M → Rs. 24.6M).
- **Furniture moved opposite to technology,** cushioning 2024's dip (Rs. 77.4M → Rs. 80.63M) before falling back in 2025 (→ Rs. 74.53M). Office supplies stayed flat and small (~Rs. 13.7–14M) throughout.

Category sales by year: Technology and furniture move in opposite directions.

The segment mix flipped and never fully reverted. Consumer led in 2023 (Rs. 85M); Home Office overtook it in 2024 (Rs. 82M vs. Rs. 75M) and extended its lead in 2025 (Rs. 84M vs. Rs. 76M)—a durable shift in NexaRetail's buyer base, confirmed independently by the Customer & Order dashboard in Section 3.

What to do

1. **Protect technology, but reduce dependence on it.**

It swings the whole P&L. Build a second engine—Furniture's 2024 performance shows it can carry growth when incentivized.

2. **Double down on regions and segments gaining share.**

Home Office's two-year lead and any regional winners deserve proportionally more marketing and inventory investment.

3. **Track margin, not just sales, as the headline KPI.**

2024 shows sales alone would have hidden a much worse profit story.

Dashboard-2

Product & Profitability Analysis

Where losses hide, and why discounting is dangerous

What Happened

Total loss-making orders followed their own mini-cycle: 191 (2023) → 209 in 2024 (+9.42%, tracking that year's margin squeeze) → 200 in 2025 (-4.31%, part of the recovery, but still ~5% above 2023). Even as the headline P&L recovered, the business is still generating more bad orders than it was in 2023.

Total loss-making orders by year

One subcategory stands out for the wrong reason: Paper's loss-making orders climbed every year—15 → 18 → 24, a 60% increase—becoming the single largest source of loss-making orders in 2024 and 2025. Sofas stayed chronically high (15 → 17 → 16); tables, by contrast, improved sharply (14 → 11 → 7), proving the pattern is fixable.

Loss-making orders by subcategory, 2023–2025

Why It Happened

In every year, the 0% discount band generates the overwhelming majority of profit (~Rs. 17M), with profit collapsing sharply as soon as any discount is applied—a pattern that holds identically across all three years.

Profit by discount band, 2023–2025 (approximate values read from the dashboard).

Paper is a structurally fragile subcategory: it's low-ticket, so shipping/handling cost is a much larger share of order value than for technology items. Any discount or cost increase pushes a slice of paper orders below breakeven—and the steady multi-year climb suggests worsening underlying economics, not a one-off blip. The same logic applies to sofas, tables, and pens: thin base margins mean any discount is disproportionately likely to create a loss. Technology's healthier 15–17% margin gives it far more room to absorb a discount before turning unprofitable—which is exactly why it stays out of the loss-order conversation entirely.

What To Do

1. Investigate the paper specifically now

A 60% rise in loss-making orders over three straight years is the clearest deteriorating trend in the dataset. Check discounting, shipping cost per order, or a specific vendor/channel, and fix pricing or minimum order value.

2. Cap or eliminate discounting on structurally thin-margin subcategories

Paper, pens, sofas, and tables are the categories most likely to flip into a loss once discounted.

3. **Study what fixed Tables and replicate it**

Its loss-order count fell every year, while Paper and Sofas didn't—an internal case study, not a hypothesis.

4. **Keep prioritizing technology**

Laptops, printers, accessories, monitors, and phones compound on two fronts at once: revenue and margin

Dashboard-3

Customer & Order Analysis

Retention is quietly eroding beneath a stable customer count

What Happened

Customer count barely moved—1,614 → 1,627 (+0.81%) → 1,603 (−1.48%)—ending slightly below where it started. Average Order Value told a different story: it dropped to a low of Rs. 72.00K in 2024 (−3.67%), then jumped to a three-year high of Rs. 75.42K in 2025 (+4.76%)—even as customer count fell. 2025's revenue held up because the customers who remained spent more per order, not because there were more of them.

Total customers (bars) vs. Average Order Value (line), 2023–2025.

The one metric that didn't fluctuate—it just kept sliding—is repeat customer rate: 60.78% → 59.00% → 58.70%, down every single year. Everything else in this review moved in a V-shape; retention moved in one direction only.

Repeat customer rate, 2023–2025: the only monotonic trend in the full review

Why It Happened

The top 5 customers by sales are completely different people every year—no customer ID repeats across 2023, 2024, and 2025—and the top customer's spend grew sharply, from Rs. 0.94M in 2023 to Rs. 1.24M in 2024, still an elevated Rs. 1.10M in 2025. New customers keep arriving, but they aren't sticking: NexaRetail is replacing its best customers each year rather than deepening relationships with them.

Top customer's annual spend, 2023–2025

2024's AOV dip lines up with that year's shrinking basket size and margin compression from Section 1—this is the customer-level cause of 2024's revenue softness. 2025's higher AOV with fewer customers confirms the "fewer, richer orders" pattern, but it also means revenue leans more heavily on a shrinking, higher-spending core. In shipping, Standard Class orders declined every year (1,240 → 1,180 → 1,121), while Second Class rose every year (384 → 407 → 449)—consistent with the Home Office segment's less time-sensitive, more price-sensitive buying pattern identified in Dashboard 1.

Orders by ship mode: a steady shift from Standard to Second Class

What To Do

1. **Treat the repeat-rate decline as the top priority metric to fix.**

It's the only trend that's worsened three years straight—build a loyalty or win-back program aimed specifically at reversing it.

2. **Build a retention track for top spenders.**

Since the highest-value customers are different people every year, create an account-management program that identifies each year's top spenders early and works to keep them.

3. **Don't mistake 2025's AOV strength for solved growth.**

It's coming from a shrinking, higher-spending base—pair any upsell push with the retention fix above.

4. **Lean into the Standard-to-Second-Class shift.**

If it reflects genuine Home Office buyer preference, consider tiered shipping incentives that match this behavior without giving away margin unnecessarily.

Bringing It Together: Prioritized Action List

Read together, the three dashboards point to the same underlying business: strong on technology, increasingly reliant on Home Office, and a shrinking pool of high-value customers, and quietly leaking value through repeat-customer attrition and a handful of structurally unprofitable subcategories. The priorities below combine all three sections into one sequence.

1. **Fix retention before chasing more growth.**

Repeat customer rate is the only metric that fell three years running. Until this reverses, every year's hard-won customers and top spenders are simply being replaced, not retained—capping the compounding value of any other improvement.

2. Resolve Paper's losses and cap discounting on thin-margin subcategories.

Paper, sofas, tables, and pens are simultaneously the categories with the most loss-making orders and the ones most sensitive to discounting. This is a controllable, near-term fix.

3. Protect and grow technology while building a second engine.

It drives sales, profit, and margin simultaneously—but the business's exposure to a single category is a structural risk worth diversifying, with Furniture the most promising candidate based on its 2024 performance.

4. Design specifically around the Home Office buyer.

This segment now leads sales, favors slower/cheaper shipping, and shows up consistently across both the Overview and Customer dashboards—treat it as the primary segment for merchandising and fulfillment decisions, not a secondary one.

5. Manage customer concentration risk.

Top-customer spend has risen ~20–30% since 2023 even as total customers shrank slightly; a small base of large accounts now carries more weight, and losing one matters more than it used to.
